

# MyCritic

## Project Charter

Anubhav Saxena, Avadhoot Joshi, Brandon Kent, Jacob Conley, Jordan Hagedorn

### Problem Statement

A website like IMDB will allow users to rate movies and TV shows, but not music. Spotify on the other hand, allows rating music, but not books. People wanting to rate content or view ratings and reviews from different mediums need to waste time navigating between sites, and managing different logins for the same. Our web application condenses different websites and media types, and provides a single place for users to rate their favourite content, accessed from across the internet.

### Objectives

- Create an intuitive website for users to add and view media reviews
- Build a database to house our reviews and user profile data
- Interface with IMDB, Spotify, and other media service APIs to pull existing reviews and media metadata
- Allow users to create accounts and add their own reviews
- Allow users to browse content using search filters
- Allow users to view new content
- Allow users to view critic activity

### Stakeholders

- Our team of 5
- Avid content critics
- Users looking for media reviews
- Advertisers

### Deliverables

- A website using ejs to easily control HTML and JavaScript. Along with implementing Bootstrap to strengthen the CSS.
- A Database to hold the reviews critics create on our website.
- A Node.js server to run the website.
- A system to allow users to rate and review media.
- Using imdb and other apis to query entertainment titles.
